Safe Disposal of Radionuclides in Low-level Radioactive Waste Repository Sites Nov 17 2022 See journals under US Geological survey. Circular 1036.

Low-level Radioactive Wastes Jul 13 2022

Review of New York State Low-Level Radioactive Waste Siting Process Oct 24 2020 This book reviews the efforts of New York state to site a low-level radioactive waste disposal facility. It evaluates the nature, sources, and quality of the data, analyses, and procedures used by the New York State Siting Commission in its decisionmaking process, which identified five potential sites for low-level waste disposal. Finally, the committee offers a chapter highlighting the lessons in siting low-level radioactive waste facilities that can be learned from New York State's experience.

Low Level Radioactive Waste Disposal Jun 19 2020

Biological Effects of Low Level Exposures Dose-Response Relationships Aug 14 2022 Biological Effects of Low-Level Exposures, more commonly referred to as BELLE, began as a conference in May 1990. Its members are committed to the enhanced understanding of low-dose responses of all types to human exposures to chemical and physical agents, whether of an expected or paradoxical nature. The focus of BELLE encompasses dose-response relationships to toxic agents, pharmaceuticals, and natural products over wide dosage ranges in both in vitro systems and in vivo systems, including human populations. While BELLE promotes the scientific understanding of low-level effects, its primary goal is the scientific evaluation of existing literature and ways to improve research and assessment methods.

Texas Low-Level Radioactive Waste Disposal Compact Consent Act Apr 10 2022

Low Level Hell May 11 2022 The aeroscouts of the 1st Infantry Division had three words emblazoned on their unit patch: Low Level Hell. It was then and continues today as the perfect concise definition of what these intrepid aviators experienced as they ranged the skies of Vietnam from the Cambodian border to the Iron Triangle. The Outcasts, as they were known, flew low and slow, aerial eyes of the division in search of the enemy. Too often for longevity's sake they found the Viet Cong and the fight was on. These young pilots (19-22 years old) "invented" the book as they went along. Praise for Low Level Hell "An absolutely splendid and engrossing book. The most compelling part is the accounts of his many air-to-ground engagements. There were moments when I literally held my breath."—Dr. Charles H. Cureton, Chief Historian, U.S. Army Training and Doctrine (TRADOC) Command "Low Level Hell is the best 'bird's eye view' of the helicopter war in Vietnam in print today. No volume better describes the feelings from the cockpit. Mills has captured the realities of a select group of aviators who shot craps with death on every mission."—R.S. Maxham, Director, U.S. Army Aviation Museum

Failure Frame: I Became the Strongest and Annihilated Everything With Low-Level Spells (Light Novel) Vol. 4 Feb 14 2020 SURVIVAL OF THE FITTEST While Mimori's journey for revenge takes him all over this magical, dangerous world, his classmates are fulfilling their destinies as "heroes" by facing off against the hordes of the Demon King. Despite the cruel world she's found herself in, S-class hero and ex-class rep Sogou Ayaka still wants to protect her weaker classmates--from their enemies, and from the cruel whims of the Goddess. But when it's just her up against an army of monsters, can she even save herself?

Handbook of Low-Level Laser Therapy Nov 24 2020 Low-Level Laser Therapy (LLLT) also known as photobiomodulation is almost 50 years old, and recently has been getting increasing acceptance from the scientific, medical, and veterinary communities. Discoveries are constantly being made about the cellular and molecular mechanisms of action, the range of diseases that can be treated is also rising, and home use LED devices are becoming common. This book compiles cutting-edge contributions from the world's leading experts in Photobiomodulation and LLLT. Chapters cover general concepts, mechanisms of action, in vitro studies, pre-clinical animal studies, veterinary applications and a wide range of clinical topics. Edited by Michael Hamblin from Massachusetts General Hospital and Harvard Medical School, aided by two prominent researchers (Marcelo Sousa and Tanupriya Agrawal), this book will appeal to anyone involved in the basic science, translational aspects and clinical applications of LLLT.

Low-level Measurements Of Man-made Radionuclides In The Environment - Proceedings Of The 2nd International Summer School Jan 15 2020 This volume gives an up-to-date account of the methods used in the detection of artificial radionuclides and their spread in the environment.

Low-Level Radioactive Waste Management and Disposition Sep 22 2020 The Department of Energy's Office of Environmental Management (DOE) is responsible for the safe cleanup of sites used for nuclear weapons development and government-sponsored nuclear energy research. Low-level radioactive waste (LLW) is the most volumetrically significant waste stream generated by the DOE cleanup program. LLW is also generated through commercial activities such as nuclear power plant operations and medical treatments. The laws and regulations related to the disposal of LLW in the United States have evolved over time and across agencies and states, resulting in a complex regulatory structure. DOE asked the National Academies of Sciences, Engineering, and Medicine to organize a workshop to discuss approaches for the management and disposition of LLW. Participants explored the key physical, chemical, and radiological characteristics of low-level waste that govern its safe and secure management and disposal in aggregate and in individual waste streams, and how key characteristics of low level waste are incorporated into standards, orders, and regulations that govern the management and disposal of LLW in the United States and in other major waste-producing countries. This publication summarizes the presentations and discussions from the workshop.

Low-level Ionizing Radiation Feb 08 2022

Assessment of Risk from Low-Level Exposure to Radiation and Chemicals Dec 26 2020 The present workshop had its origins in discussions among Alexander Hollaender, Oddvar Nygaard, Donald Borg, Richard Setlow and Victor Bond on the need for a symposium that would deal with a broad spectrum of pressing subjects related to the physics, chemistry, and biological actions of ionizing radiations, and the theoretical and practical problems of risk assessment. It soon became apparent that the spectrum of subjects considered was too broad for the desired depth of coverage; in fact, it seemed unlikely that the conference participants would have the background knowledge to span the gamut. Therefore, two separate meetings were decided upon, the first of which, Comparison of Mechanisms of Carcinogenesis by Radiation and Chemical Agents, was held at the National Bureau of Standards, Gaithersburg on December 6-7, 1983. The meeting was sponsored by the NCI. The second meeting has emerged as the present workshop at Brookhaven National Laboratory. An interface between the two conferences has been provided by Michael Fry and Donald Borg, who have summarized the salient points emanating from the NCI Symposium. We intended that the first conference should focus on the basic mechanisms of radiation and chemical carcinogenesis, while the second, the present meeting, would emphasize exposure-response relationships, particularly the theoretical and practical similarities and differences between exposure to chemical carcinogens compared to exposure to ionizing radiation.

Low-level Radiation Jul 01 2021

Low-Level Environmental Radioactivity Oct 04 2021 From the Introduction Low-level radioactivity is related to those radioactive sources of ionizing radiation that are characterized by low activities. Sometimes activity here does not represent total amount of radionuclides but rather their concentration. In other cases, the total activity may be quite high, but we can measure only a relatively small portion of the material. "Low" may have, for different situations and circumstances, not only considerably different meanings but also different absolute values as far as the activity or activity concentration is concerned. For example, one can refer to low activity in the case of radiocarbon dating, where the concentration of ¹⁴C is actually lower than its natural concentration, and also in the case of radon monitoring where, especially in mines or in some enclosed spaces, its concentration may be several thousand times higher than the outdoor "atural" concentrations. Emphasis is now being placed on the analysis of naturally occurring radionuclides in the environment or on the release of radionuclides from their different man-made sources because liquid and aerial discharge level controls have become more rigorous. In addition, the applicability of low-level methodology increases the extent of different radionuclide applications considerably. Since individual radionuclides differ in their decay scheme and particles emitted as well in their energies, there is no universal method for the accurate measurement of all radioactive sources. Moreover, there is usually a mixture of radionuclides in a sample, causing some difficulties in a selective evaluation of a given radionuclide. Due to the random nature of radioactive disintegrations, the appropriate interpretation of the experimental results would be, in most cases, impossible without elaborate statistical treatment and evaluation of the data obtained. Thanks to the availability of computer-based instrumentation, the measuring data can be, in most cases, processed and evaluated on-line, which makes it possible to control and optimize the experiment in order to extract the maximum amount of information carried by the detector response. The purpose of this book is to provide an introduction to low-level radioactivity assessment and to clarify the nature of its sources, as well as the principal methods used in its measurement. Our evaluation is concentrated on the present-day aspects of low-level methodology. The book may be useful for all who need highly sensitive analysis of natural or artificial radioactivity both within and outside the nuclear field. The attempt of this book is to summarize the sources of environmental radioactivity and their possible radiological impact in terms of resulting doses to the population, and to present a sound review of the measuring methods and techniques for the evaluation of low-level radioactivities encountered in both the environment and in a number of applications where radioactive sources are used as a means of obtaining important information.
