Vols. for 1887-1946 include the preprint pages of the institute's Transactions. Born and Raised in Sawdust: My Journey Around the World in Eighty Years is the deeply moving autobiography of Lewis Thigpen as a black boy growing up in a loving family in a small, tight knit community in the deep South during the extremely segregated Jim Crow era. It captures his life on the farm and in school in a revealing, instructive, yet colorful way despite the discrimination he encountered. Fearful of being a farm worker or common laborer for the rest of his life, he joined the U.S. Army, where racism persisted even though President Truman had ordered desegregation of the entire military in 1948. He served for three years. Against the odds, Thigpen persevered. Despite adversity and lack of money, he attended college, earned the Ph.D. degree, and became a renowned engineer, research scientist, and scholar. He rose to become chair of mechanical engineering at a distinguished university. The book is an easy read, designed for those who choose to pick it up at a bookstore, order it online, check it out at their public library, or download it to Kindle or other apps. It is a valuable addition to the canon of biographies, histories, literary works and cultural studies of the South. It captures the mood of Southern writers such as Flannery O'Conner, Pearl Cleage, William Faulkner, Richard Wright and Ralph Ellison. Readers interested in family history and ancestry will love tracing through Dr. Thigpen's family tree, photographs and drawings. One photo shows him holding a silver salmon, the outcome of one of his favorite hobbies—fishing. In his autobiography, Dr. Thigpen brings the clarity and conciseness of an engineer and research scientist who has written and published numerous articles in refereed journals. Included on BookBub's "The Most Exciting Memoirs Coming Out in 2018" list Krishan Bedi came to the United States in December of 1961 at the tender age of twenty. He had only \$300 in his pocket, and he had made it out of his small village in India on sheer faith, determined to get education in the US. For him, there was no option but to succeed—so he began his new life in Knoxville, Tennessee, where he had to adapt to the culture shock not only of being in the US but a Punjabi man in the South in the 1960s. *Engineering a Life* is an examination of Bedi's life, and how he has handled the plethora of curve balls thrown his way with determination, humor, and an unwavering faith that everything would work out. This is a book about values and faith and the importance of friendship, family, and hard work. It's a story about achieving the American Dream, proving that no matter how thoroughly you map out your life's journey, no matter how many blueprints you draw up, when you veer off the course you've plotted—as we all do, somehow, in the end—you end up where you're supposed to be. Includes preprints of: Transactions of the American Institute of Electrical Engineers, ISSN 0096-3860. The majority of professors have never had a formal course in education, and the most common method for learning how to teach is on-the-job training. This represents a challenge for disciplines with ever more complex subject matter, and a lost opportunity when new active learning approaches to education are yielding dramatic improvements in student learning and retention. This book aims to cover all aspects of teaching engineering and other technical subjects. It presents both practical matters and educational theories in a format useful for both new and experienced teachers. It is organized to start with specific, practical teaching applications and then leads to psychological and educational theories. The "practical orientation" section explains how to develop objectives and then use them to enhance student learning, and the "theoretical orientation" section discusses the theoretical basis for learning/teaching and its impact on students. Written mainly for PhD students and professors in all areas of engineering, the book may be used as a text for graduate-level classes and professional workshops or by professionals who wish to read it on their own. Although the focus is engineering education, most of this book will be useful to teachers in other disciplines. Teaching is a complex human activity, so it is impossible to develop a formula that guarantees it will be excellent. However, the methods in this book will help all professors become good teachers while spending less time preparing for the classroom. This is a new edition of the well-received volume published by McGraw-Hill in 1993. It includes an entirely revised section on the Accreditation Board for Engineering and Technology (ABET) and new sections on the characteristics of great teachers, different active learning methods, the application of technology in the classroom (from clickers to intelligent tutorial systems), and how people learn. A straight-forward, easy to understand presentation of hydraulic and hydrologic

processes using the control volume approach. The author extends these processes into practical applications for water use and water excess, including water distribution systems, stormwater control, and flood storage systems. *The Martians* is the engaging story of five little-known Hungarian physicists who transformed 20th century science. They emigrated to the United States from Hungary in the 1930's, and were important contributors to such important experiments as the Manhattan Project. Various recognized with the National Medal for Science, the Presidential Medal of Freedom and the Nobel Prize for physics, these five remained close friends throughout their lives. Through decades of political and social upheaval, they held onto their Hungarian identities and were fervently opinionated and politically active, reactionaries against the fascism and anti-Semitism with which they had grown up. Based on the author's personal relationships with the subjects and many interviews with their contemporaries, *The Martians* is an exhaustively researched, fascinating story of an important era in American, Hungarian, and scientific history. *Equivalence: Elizabeth L. Scott at Berkeley* is the compelling story of one pioneering statistician's relentless twenty-year effort to promote the status of women in academe and science. Part biography and part microhistory, the book provides the context and background to understand Scott's masterfulness at using statistics to help solve societal problems. In addition to being one of the first researchers to work at the interface of astronomy and statistics and an early practitioner of statistics using high-speed computers, Scott worked on an impressively broad range of questions in science, from whether cloud seeding actually works to whether ozone depletion causes skin cancer. Later in her career, Scott became swept up in the academic women's movement. She used her well-developed scientific research skills together with the advocacy skills she had honed, in such activities as raising funds for Martin Luther King Jr. and keeping Free Speech Movement students out of jail, toward policy making that would improve the condition of the academic workforce for women. The book invites the reader into Scott's universe, a window of inspiration made possible by the fact that she saved and dated every piece of paper that came across her desk. This guide offers helpful advice on how teachers, administrators, and career advisers in science and engineering can become better mentors to their students. It starts with the premise that a successful mentor guides students in a variety of ways: by helping them get the most from their educational experience, by introducing them to and making them comfortable with a specific disciplinary culture, and by offering assistance with the search for suitable employment. Other topics covered in the guide include career planning, time management, writing development, and responsible scientific conduct. Also included is a valuable list of bibliographical and Internet resources on mentoring and related topics.
