Lessons from the Sand Feb 14 2020 Ever wonder where sand comes from? Or why shells are colored differently? Or how to estimate the size of a wave? Featuring more than forty fun hands-on activities for families with children, *Lessons from the Sand* reveals the science behind the amazing natural wonders found on the beaches of North Carolina and South Carolina. Easy-to-do experiments will help parents and kids discover the ways water, wind, sand, plants, animals, and people interact to shape the constantly changing beaches we love to visit. Featuring colorful illustrations and clear instructions, most activities require nothing more than an observant eye and simple tools found at local stores. You will learn about geology, weather, waves and currents, the critters that live on our beaches, and the environmental issues that threaten them. Chapters also include indoor activities for rainy days and activities for nighttime discovery. This book will become an indispensable companion for families, teachers, and students heading to the Carolina coast for years to come.

Brazilian Beach Systems Nov 05 2021 This book is about the more than 4,000 beach systems that form most of the 9000 km long Brazilian coast. It focuses on the beaches of each of the seventeen coastal states and three oceanic islands, their nature, morphodynamics and status. It is a must for anyone who wants to know more about this great coast and its

beach systems. This is the first book ever written about the beach systems of Brazil, and actually the very first about the beaches of an entire country. The Brazilian coast extends from the mighty Amazon River and its muddy shores in the north to one of the world's longest sandy beaches in the southern Rio Grande do Sul. It contains every beach type from wave to tide-dominated which range in size from small embayed beaches to long barrier beaches. The book is written by leading Brazilian academics and researchers and aims at the university level market, as well as coastal scientists, engineers and managers. Standard scientific terminology is used to describe the coast and its beaches. It is illustrated with more than 400 original figures and serves as a benchmark text on the Brazilian coast.

Seashore Life of Southern California Mar 09 2022 The dry land is one world and the wet sea is another, but the line separating them is ever-changing. Known as the intertidal zone, the area between the land and the sea is defined by the extremes of the tides. Sam Hinton provides an introduction to this fascinating zone and its contiguous waters and to some of the many creatures who make the southern California seacoast their home. This highly readable book has been for many years the handiest resource available for anyone wanting to explore that region's delights and mysteries. The book is filled with interesting anecdotes and drawings and has a thorough discussion of the natural forces—the tides, winds, storms, currents, surf, and ocean chemistry—that affect near-shore animals. Also included is a section relating the ocean forces to the intertidal habitat, along with a map of southern California locations where one might observe the organisms described in the book.

Thailand Through Photographs: Northern Temples and Southern Beaches Jan 19 2023 This book exhibits hundreds of images from a trip to both Thailand's northern and southern regions, including stops in Ayutthaya, Sukhothai, Chiang Mai as well as Ko Phi Phi, Ton Sai, and Phang Nga. Shown herein are sites such as the ruins of former capital cities of Siam, the Thai Elephant Conversation Centre, the filming locations of both *The Beach* and *The Man with the Golden Gun* and the Sino-European architecture of Phuket Town, among more. From Chiang Mai's golden plated temples, to Ton Sai's rock climbing, everything from

architecture, scenery, and tourist attractions to food, people and shopping is displayed through hundreds of gorgeous photographs, captured on a basic point-and-shoot digital camera, just as you'd see them if you were walking around yourself - absolutely no editing, filters, special lenses have been applied. All photographs may be reproduced for any of the reader's purposes, provided appropriate source referencing.

Secret Beaches of the Salish Sea May 19 2020 The fourth volume in the Secret Beaches series, one of two on the Salish Sea, covers 93 beaches in the southern Gulf Islands, including Salt Spring, Galiano, Saturna, Mayne, Thetis and Pender. At some locations, the selling point is a view of sandstone eroded into astounding curves and honeycombed lattices. At others, it's the chance of seeing the resident orcas of J1, K1 and L1 pods, whose summer home is the Gulf Islands. Theo's hand-drawn maps are indispensable, as each island marks its public beach access points differently, if they mark them at all. His detailed entries give comprehensive descriptions and an illustrative photo or painting for each beach. As usual, the charming paintings and photos are done by Theo himself. Whether seconds from the ferry or farther along a twisting, unsigned back road, the beach best suited to your adventure waits to be found in Secret Beaches of the Salish Sea.

A Thousand Thirsty Beaches Jul 01 2021 Lisa Lindquist Dorr tells the story of the vast smuggling network that brought high-end distilled spirits and, eventually, other cargoes (including undocumented immigrants) from Great Britain and Europe through Cuba to the United States between 1920 and the end of Prohibition. Because of their

proximity to liquor-exporting islands, the numerous beaches along the southern coast presented ideal landing points for smugglers and distribution points for their supply networks. From the warehouses of liquor wholesalers in Havana to the decks of rum runners to transportation networks heading northward, Dorr explores these operations, from the people who ran the trade to the determined efforts of the U.S. Coast Guard and other law enforcement agencies to stop liquor traffic on the high seas, in Cuba, and in southern communities. In the process, she shows the role smuggling played in creating a more transnational, enterprising, and modern South.

How to Read a North Carolina Beach Aug 14 2022 Take a walk on the beach with three coastal experts who reveal the secrets and the science of the North Carolina shoreline. What makes sea foam? What are those tiny sand volcanoes along the waterline? You'll find the answers to these questions and dozens more in this comprehensive field guide to the state's beaches, which shows visitors how to decipher the mysteries of the beach and interpret clues to an ever-changing geological story. Orrin Pilkey, Tracy Monegan Rice, and William Neal explore large-scale processes, such as the composition and interaction of wind, waves, and sand, as well as smaller features, such as bubble holes, drift lines, and black sands. In addition, coastal life forms large and small--from crabs and turtles to microscopic animals--are all discussed here. The concluding chapter contemplates the future of North Carolina beaches, considering the threats to their survival and assessing strategies for conservation. This indispensable beach book offers vacationers and naturalists a single source for learning to appreciate and preserve the natural features of a genuine state treasure. Southern Gateways Guide is

A Rambling Sketch in and About Laguna and Arch Beaches, Orange County, California (Classic Reprint) Aug 02 2021 Excerpt from A Rambling Sketch in and About Laguna and Arch Beaches, Orange County, California Laguna Beach is one of the oldest beaches on the Southern coast, where the early pioneers from the interior gathered for their picnics and vacations in horse-drawn vehicles, but on account of it being off the main traveled road, kept its growth back for a decade. Now, that we have automobiles, and count time instead of miles, distance no longer lends enchantment to the view, as will be exemplified to those who visit this beautiful and charming beach. Passing through Laguna canyon you will notice mammoth boulders on each side of the boulevard, grotesque and fantastical in their many shapes and figures, like elves and fairies in a ring, seeming to beckon you on to the water front, where Nature has builded well for all lovers of beautiful surroundings. Although it is least known of the Southern beaches, because of its distance from Los Angeles and interior cities, the lover of outdoor grandeur and scenic wonders, will find more to enthral him at Laguna and Arch Beaches than at any other watering spot on the South coast. La Jolla. San Diego county, is a close rival in relative beauty. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Southern California Beaches Dec 18 2022 This study utilizes a holistic, ethnographic approach to explore beach use in Southern

California by highlighting the experiences and views of surfers, the local fishing community, and divers, with special attention paid to those who utilize and have attachment to County Line Beach, Los Angeles. This project began as a traditional ethnography, with the original research design including participant observation, transect walks, mapping, and behavioral observation, but due to the COVID-19 pandemic, the research instead ultimately relied on survey and interview that could be conducted over the Internet, thus limiting access to all users of the coast. Additional data in the form of public posts and comments were collected through several social media websites including Facebook and Reddit. The data collected sheds light on stakeholder interactions and groups' attachments to beaches in Southern California, and what originally began as an assumption that crowded and well-utilized beaches such as County Line Beach in Los Angeles would breed resentment, conflict, and competition between users was ultimately not demonstrated throughout this project. It appears, despite all of the possibilities for conflicts and contentions at beaches in Southern California between surfers, bikers, fishermen and women, environmentalists and preservationists, tourists, beach-goers, and others vying for space, the social relationships at the beaches are relatively constructive, with constituents describing overarching feelings of respect, empathy, and appreciation for other people using the space. Using a mixed-methods design, data were collected through surveys and semi-structured interviews between June and September 2020, in order to home in on local users' experiences at the beach and with external stakeholders, such as policy makers, as well as those within their own group. This thesis uses grounded theory and provides commentary on environmental initiatives, increasing privatization of public areas, and the uniquely robust culture of Southern California beaches by exploring answers to the main question of how local community members are using beaches in Southern California. *Moon Southern California Road Trips* Oct 04 2021 Catch a wave, hike to the Hollywood sign, or soak up some desert sun: the possibilities are endless with Moon Southern California Road Trips. [How to Read a Florida Gulf Coast Beach](#) Feb 20 2023 Come explore the geology of Florida's Gulf Coast beaches, from a bird's-eye view down to a crab's-eye view. You'll journey from Panhandle sugar-sand beaches to southwestern shell beaches, taking a fresh look at the ever-changing landscape. With Tonya Clayton as your guide, you'll learn how to recognize the stories and read the clues of these dynamic shores, reshaped daily by winds, waves, and sometimes bulldozers or dump trucks. This dynamic tour begins with a broad description of Florida's Gulf Coast, roaming from popular Perdido Key in the northwest to remote Cape Sable in the south. You'll first fly over large-scale coastal features such as the barrier islands, learning to spot signs of the many

processes that shape the shores. In subsequent chapters you'll visit dunes and beaches to check out sand ripples, tracings, and other markings that show the handiwork of beach breezes, ocean waves, animal life, and even raindrops and air bubbles. You'll also encounter signs of human shaping, including massive boulder structures and sand megatransfers. With a conversational style and more than a hundred illustrations, *How to Read a Florida Gulf Coast Beach* makes coastal science accessible, carrying vacationers and Florida natives alike on a lively, informative tour of local beach features. [Secret Beaches of Southern Vancouver Island](#) Jan 07 2022 This is your guide to dozens of spectacular and often hidden beaches on the eastern coast of Vancouver Island between Qualicum and the Malahat. While some of them are well used by people living nearby, many are virtually impossible to find without combing through official maps and back-road guides. From tiny rocky coves to broad sandy beaches, these public-access spots are enormously diverse. Just as important as finding these spots is knowing what to expect. Thus each location is accompanied by detailed information that any beach explorer should know before setting out. Is the beach a few level steps from a vehicle or down a high, steep bank? Is the beach suitable for children? Large groups? Kayakers? All of these questions and many more are answered in this book, which includes Theo's hand-drawn maps, photographs and artwork. Watch sea lions in the winter (Higginson Road) Paint one of the few great views of Mt. Arrowsmith—go before noon for dramatic light (Rowland Road) Head to the most child-friendly beach between Crofton and the Malahat (Cherry Point Nature Park) Splash and swim in warm water over sand (Benwalden Road) Refresh your pleasure in the shore and head out to picnic, play, launch kayaks, watch winter storms or just enjoy the waves.

Size Analysis of Sand Samples from Southern New Jersey Beaches Oct 12 2019 The size of sand on Atlantic coast beaches of southern New Jersey was studied by analyzing 788 sand samples. In north-to-south order, the samples were collected by Island Beach, Long Beach Island, Brigantine, Atlantic City, and Ludlam Island. Sand size generally decreased from north to south, with size at the two northermost sites noticeably coarser on the average than the size at the three southern sites. Results from Long Beach Island, Atlantic City, and Ludlam Island, where most of the data were collected, indicate that size, averaged by beach, decreases from 0.33 millimeter at Long Beach Island in the north, through 0.27 millimeter at Atlantic City, to 0.23 millimeter at Ludlam Island in the south. Size, averaged by profile line, varies from 0.34 millimeter at a profile on the northern half of Long Beach Island, 0.20 millimeter at a profile in the middle of Ludlam Island. Size also varies with position across the profile from low tide terrace to landward edge of berm, tending to decrease landward across the average of three profiles on Atlantic City and three profiles on Ludlam Island, but tending to increase landward across the average of four profile lines on Long Beach Island. Maximum variation at one Beach, averaged by position on profile, occurs at Long Beach Island where the average size increased from 0.28 millimeter on the low tide terrace to 0.36 millimeter on the berm. Size variation by month suggests a tendency for sand to be finer during late summer and early fall, but data do not permit identification of a consistent annual cycle.

Sediment Transport and Abrasion Rates on Mixed Sand and

Gravel Beaches Apr 17 2020 Gravel beaches provide an effective means of natural sea defence as they are usually stable under sustained wave attack. There has been growing interest in the application of coarse grained sediments as a form of coastal protection but there is a deficit in knowledge on the fundamental processes of sediment transport on gravel beaches. Unlike sandy beaches, mixed sand and gravel (MSG) beaches only deal with a single breaker which occupies the same position under all wave conditions. The reflective nature of gravel beaches enables them to adapt dynamically to disturbance and buffer the impacts of incident wave energy. MSG beaches are prevalent on the southern Hawke's Bay coastline, much of which experiences chronic erosion and faces ongoing coastal management concerns. Model predictions are required for management decisions, but there is a lot of uncertainty in model assumptions due to lack of field measurements of sediment transport rates and sediment mass loss during transport. In this thesis RFID technology was used to directly measure in-situ abrasion loss and sediment transport rates at two locations, Clifton and Awatoto, in southern Hawke's Bay. These sites were selected because the southern beaches are chronically eroding and northern beaches exhibit accretion. 1000 cobbles were tagged in total with 400 released at Clifton and 600 released at Awatoto. Observations confirm that alongshore sediment transport rates are eight times faster in the south (0.8 m/day at Clifton) than in the north (0.1 m/day at Awatoto). Abrasion loss was found to vary considerably with no correlation to the size or shape of cobbles, or the net transport distance. On average cobbles abraded at a rate of 0.29 %/km at Clifton and 22%/km at Awatoto. The results validated the estimates of the UNIBEST shoreline prediction model and draw attention to the link between rapid alongshore sediment transport and coastal erosion versus slow alongshore sediment transport and coastal accretion. The results also reinforce the applicability of RFID experiments as a tool for measuring in-situ abrasion loss. This study addressed gaps in the knowledge on the fundamental processes of sediment transport on gravel beaches. Rates of alongshore sediment transport validated predictions of the UNIBEST model and revealed that while alongshore sediment

transport is the dominant mode of cobble movement in fair-weather conditions, storm events drive cross-shore transport. The abrasion experiment was the biggest of its kind in the southern Hawke's Bay. The results identified the applicability of RFID technology as a means of measuring in-situ abrasion and provide a foundation for future abrasion measurements.

Saltwater People of the Fatal Shore Sep 15 2022 Saltwater People of the Fatal Shore was awarded the 2013 Biennial Frank Broeze Maritime History Book Prize sponsored jointly by the Australian Association for Maritime History (AAMH) and the Australian National Maritime Museum (ANMM). Saltwater People of the Fatal Shore - Sydney's Southern Beaches is a detailed history of that beautiful stretch of Sydney's coastline between South Head and Royal National Park. This coastline features world renown beaches such as Bondi, Maroubra and Cronulla, as well as places of great historical interest. Botany Bay was where James Cook first made landfall on the east coast of Australia and made claim to the continent. It was also where the First Fleet arrived with its human cargo. Before these events it was home to the Aboriginal people of the Eora, Dharug and Dharawal nations for tens of thousands of years. The focus of Saltwater People of the Fatal Shore is on the shoreline... that high energy intersection between sea and land where waves, whipped-up by wind and storms, sometimes thousands of kilometers out to sea, announce their arrival in a final dramatic explosion... or caress it with a gentle cascade. This constant, hypnotic dance with the shore can be calming, and it can be confronting. When the swell appears excitement grows and the coastline becomes energized. The surfzone both attracts and influences us... and in turn our presence affects this playground on the edge of the vast Pacific. The foreword for the book was written by the Hon. Linda Burney MP. Upon her election she became the first Aboriginal person to serve in the New South Wales Parliament. Burney, a Wiradjuri woman, is currently Deputy Leader of the Opposition, and is the shadow minister in several key portfolios. The Saltwater People books have been shortlisted for the 2013 biennial Frank Broeze History Prize through the Australian National Maritime Museum.

In 2012 Cyclops Press was recognized with a Pauline McLeod Reconciliation Award for its work promoting meaningful reconciliation.

Beaches Near San Francisco, California, 1957-1958 Jul 13 2022 Eighteen profiles on beaches in the vicinity of San Francisco were occupied at intervals of 2 to 6 months from JULY!(%+ TO December 1958. Seven of these profiles are north of the Golden Gate and eleven are south. Individual beaches differ from one another and the same beach differs from season to season and from place to place at any given time. The data collected neither support nor disprove the notion that beach sand is statistically finer and better sorted in summer than in winter. Likewise, the data do not support the contention that finer grained sands are better sorted. (Author).
